

## WE CUSTOMIZE OUR ENGAGEMENT MODEL FOR EACH CLIENT & PROJECT.

Our high level product development process is a great starting point to understanding where you are along your journey and what questions we need to address along the way.

### When innovating with Voice UI, these are some questions we often answer along the way

- + How can conversational voice assistant technology be used to augment a digital services offering?
- + How can embedded voice technology transform the user experience of my products?
- + What are the trade-offs between performance, reliability, cost, privacy, availability, and industrial design in selecting microphone, speaker, signal processing, compute, and communications solutions?
- + How well does the candidate voice solution architecture perform in real-world situations?
- + Does the device meet all requirements for the "Works with Alexa" certification?
- + Are users interacting with my product in unexpected ways, and how can I adapt my product?
